

CHOOSE MUSCLE WALL

Protecting what matters most is what we do best. Muscle Wall has a powerful, yet lightweight design that enables just a few people to set up hundreds of feet of protection that will effectively stand up to the elements around the clock.

SPECS

Muscle Wall comes in either 2 or 4 foot tall sections that are both 6 feet long, or 8 foot tall sections that are 4 feet long and constructed with durable low density polyethylene. Muscle Wall is connected together by an effective coupler.

QUICK, EASY, & AFFORDABLE

Muscle Wall can be quickly deployed, removed, and consolidated for storage. Muscle Wall is light enough to carry or, if flooding is already occurring, float into place. Once filled with water Muscle Wall becomes a solid barrier.

MUSCLE WALL VS. SAND BAGS

Unlike sand bags, Muscle Wall is reusable, reliable, and recyclable. Life cycle costs of Muscle Wall are far below that of sand bags, which can only be used once, allowing for disaster funds to be spent toward other emergency projects.

THE TRUE COST OF SAND BAGS

According to the USACE, the true cost of sand bags, including transportation, manpower, and disposal, is estimated to be \$2.50-\$5.00 per bag. This equates to \$1,170-\$2,340 per each 4ft tall by 6ft long section of Muscle Wall.

TESTIMONIAL

“Since our first introduction to Muscle Wall, we realized that you had brought the state of the art to an entirely new level.”
